

An aerial photograph of a residential neighborhood. The houses are arranged in a grid-like pattern with winding streets. A large, dark green, roughly circular area is visible in the upper center, possibly a park or a large lawn. A river or stream flows through the lower part of the image. The overall scene is captured from a high angle, showing the layout of the community and its proximity to water.

The Hydrologic Cycle
Streams
Flooding

Total Evaporation = Total Precipitation = 500,000 km³/yr

Water Reserves

- Most of the Earth's water is saline (salt water)
- Of the remaining, most is locked up in glacial ice

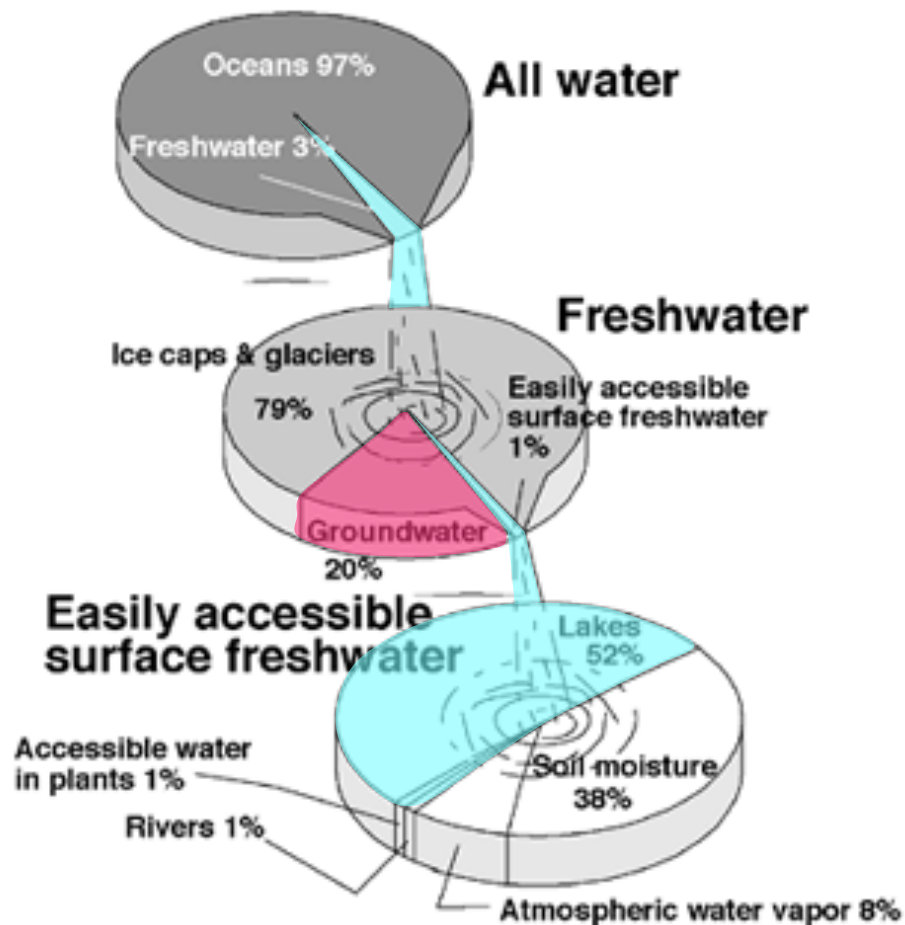

Figure 2. Distribution of the World's Water

Source: Lean & Hinrichsen 1994 (107)

- Less than 1% of the Earth's freshwater is on the surface at any time.
- 20% of the freshwater flows through the ground – **groundwater**.

WATER SCARCITY

WATER USE HAS BEEN GROWING AT MORE THAN TWICE THE RATE OF POPULATION INCREASE IN THE LAST CENTURY

INCREASE IN WATER WITHDRAWALS BY 2025

50%

DEVELOPING COUNTRIES

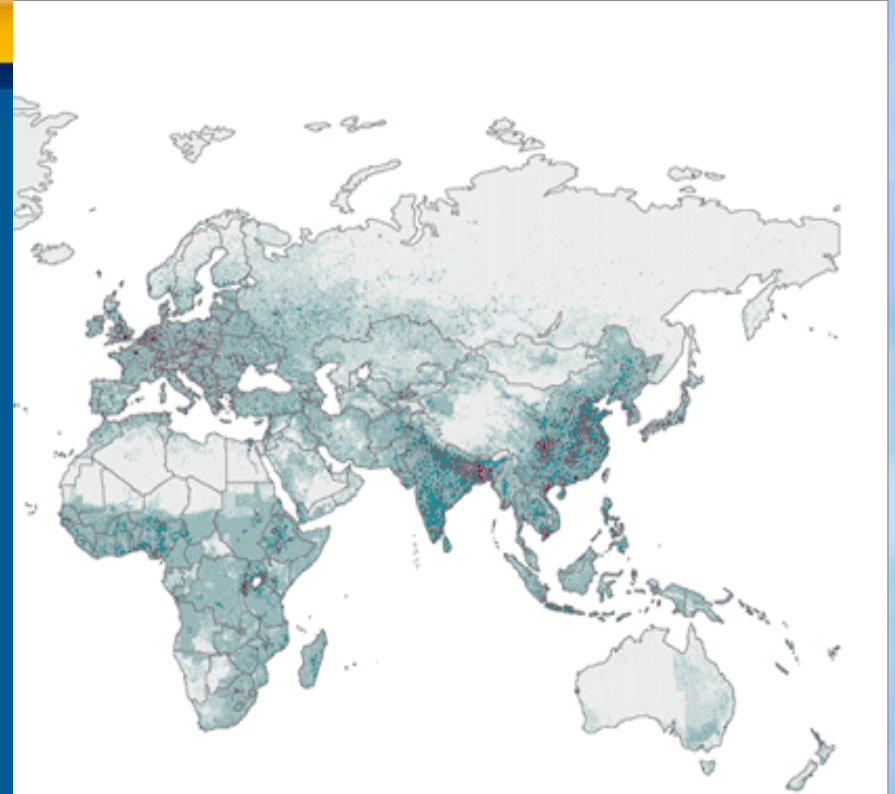

18%

DEVELOPED COUNTRIES

By 2025, 1800 million people will be living in countries or regions with absolute water scarcity, and two-thirds of the world population could be under stress conditions

East Texas: Gulf of Mexico influence, soggy

West Texas: mountains, desert

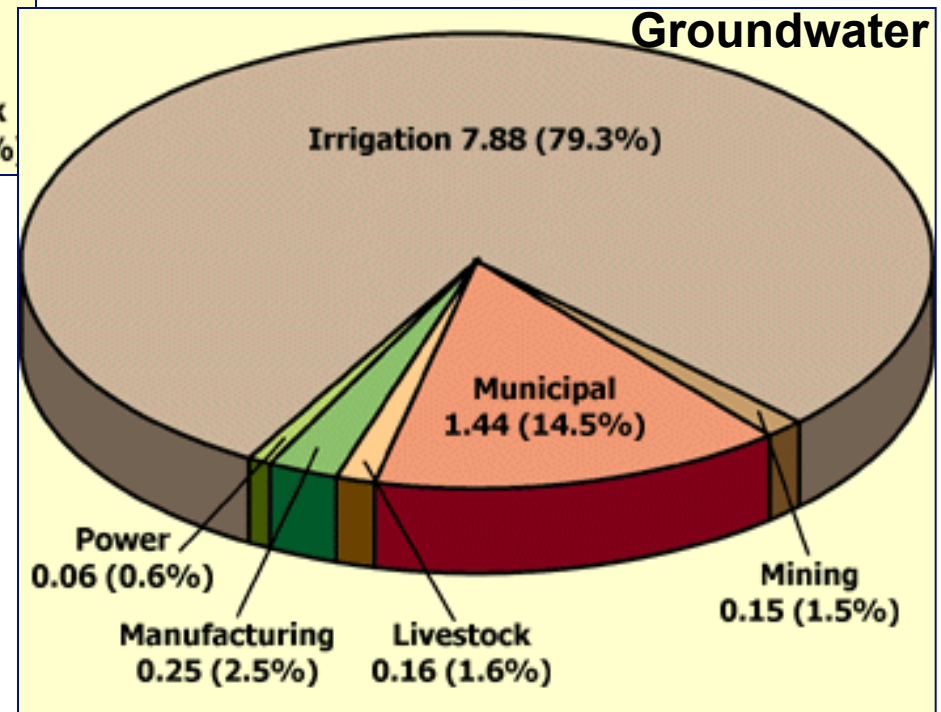

West Texas: Agriculture, mining

East Texas: Houston, Dallas

Texas Water Use

Texas Water Use

Most water for agriculture is drawn from the ground.

If the rate of withdrawal exceeds aquifer recharge, the resource becomes depleted

Stream: body of running water that is confined to a **channel** and moves downhill due to gravity

FIGURE 17.13 Cross-sectional profile

Drainage Basin: total area drained by a stream. Larger streams have larger drainage basins.

The size and composition of the sediment carried by the stream depends on the nature of the drainage basin.

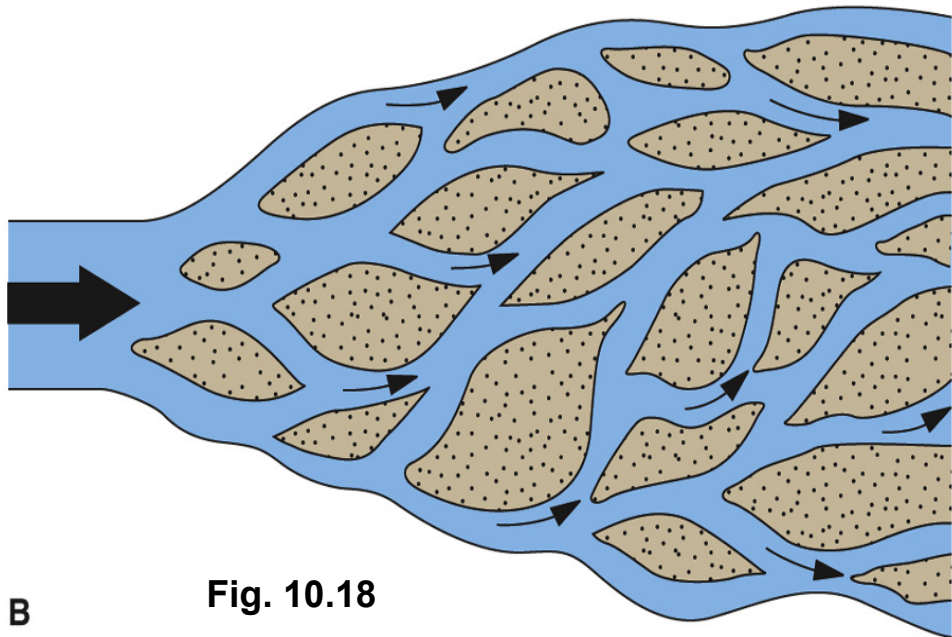

(c)

FIGURE 17.11

A

B

Fig. 10.18

Braided Streams

DISPERSED CHANNELS

Streams with high sediment loads deposit lots of channel bars. The stream moves around the bars, wending through the barriers.

Usually found near sediment source areas and/or areas with easily eroded substrate.

Braided stream fed by a glacier in Alaska. The sediment load is very high, and the substrate is loose sediment.

(b)

FIGURE 17.21

Meandering Stream

Deposition occurs on **point bars**, where stream velocity is low

Erosion occurs on **cutbanks**, where stream velocity is high

Cross sections
Fig. 10.06

Meandering Stream

Fine-grain sediment is usually deposited in:

point bars - sediment deposited on the banks of a stream

channel bars - sediment deposited within the stream channel

Coarse-grain sediment is usually found in the stream channel. The largest clasts move only during floods

Meandering Streams

Once started, a **meander** tends to become more pronounced through lateral erosion.

The **cutbank** at the start of the meander frequently cuts through the meander neck, diverting the flow of water.

New sediment deposition isolates the old meander from the stream, forming an **oxbow lake**.

Fig. 10.24

A

Flood Plain: area habitually flooded by a stream at high water. Contains fine-grain sediment deposited during flooding

B

Natural levee: low ridges formed along sides of main stream channel during flooding.

C

Fig. 10.27

Stream Budget

Water In (Inflow)

Discharge from upstream

Surface runoff

Groundwater influx

Direct precipitation

Water Out (Outflow)

Rate (slope-dependent)

Capacity (shape-dependent)

| \leq 0 normally

| $>$ 0 channel fills

If channel fills completely, river can overflow banks and flood

WaterWatch

Thursday, March 06, 2008 10:30ET

Current water resources conditions. Map of real-time streamflow compared to historical streamflow for the day of the year (United States).

Blue and black dots indicate high relative percentages, green is normal, orange and red are low values

WaterWatch

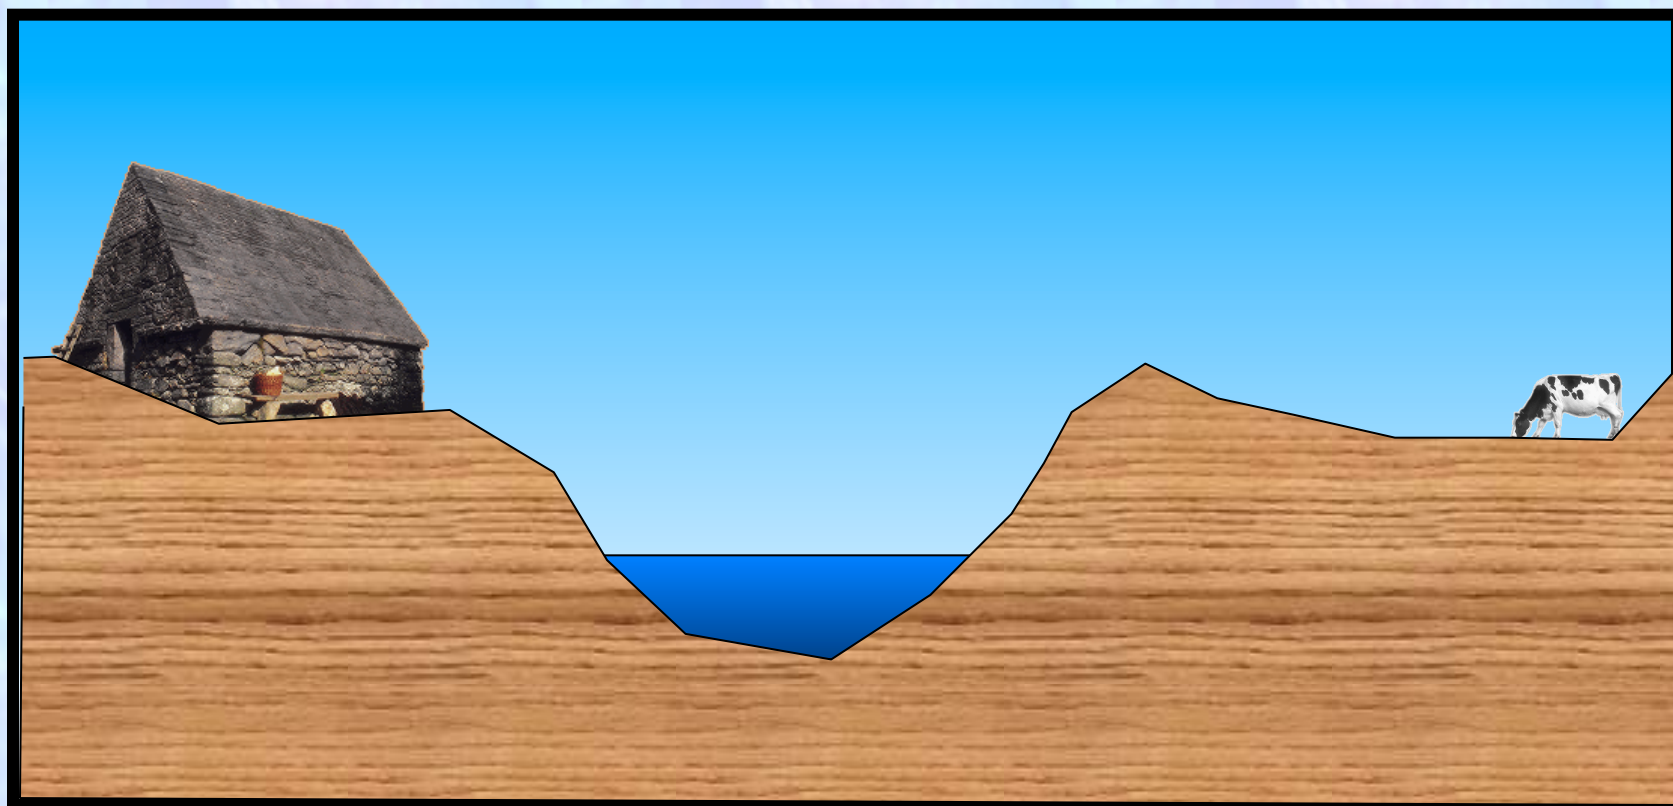

The WaterWatch system allows you to download data from individual monitoring stations. This is the data from earlier this year for the gauge hanging over the Mount Gallant Rd. bridge over Big Dutchman Creek.

WaterWatch

This is from a gauge from below one of the dams on the Catawba river. The weird pattern is caused by controlling outflow from a hydroelectric dam.

Dream Home?

20 Year Flood Record

NO SALE

Dream Home?

What is the probability of this house drowning while you own it?

$$\text{Probability} = 1 - (1 - (1 / \text{return interval}))^{\text{elapsed interval}}$$

$$\text{Probability} = 1 - (1 - (1 / 40))^{\text{20 years}} = 40\%$$

Elapsed Interval (yrs)	Flood Probability
5	12%
10	22%
15	32%
20	40%
40	64%
60	78%
100	92%
120	95%

Discharge

Volume of water per unit time that passes a specific point on the river.

$$Q = V \times W \times D \quad \text{m}^3/\text{s}$$

average width (m)

water velocity (m/sec)

average depth (m)

gauge house

records continuous
record of river level

Tracking Discharge

flow weir

records continuous
record of river discharge

Mississippi River (Alton, Illinois)

Danube River

Determining Return Interval (RI) based on maximum yearly discharge (Q_{\max})

Weibull Equation

$$RI = \frac{(n+1)}{m} = \frac{(\text{\# of years recorded} + 1)}{\text{rank of recorded value}}$$

Fake River

<u>year</u>	<u>Q_{\max}</u>	<u>rank</u>	<u>RI</u>
1963	2550	1	8.0
1964	2490	2	4.0
1970	1280	5	1.6
1971	1380	4	2.0
1980	1600	3	2.7
1982	1240	6	1.3
1986	1230	7	1.1
